

Cinerific Android App Work Log - September 29, 2026 Part 2 (U.S. EST)

Compiled summary for Tuesday, September 29, 2026 (U.S. Eastern Time) - focus: standardizing Movies and Shows genre navigation across responsive layouts, then completing a sustained portrait-phone Settings refinement pass covering profile identity, sticky behavior, section geometry, toggle proportions, and physical-device validation.

Generated in continuity with the established Cinerific worklog cadence from July 12 through September 29: compact opening summary, source-material review, baseline state, goals, themed work-completed sections, validation, files touched, follow-up context, and output-artifact close. A September 29 PDF already existed, so this artifact follows the established same-day convention and uses the Part 2 suffix. Eastern time was independently verified live as Tuesday, September 29, 2026 in EDT, UTC-04:00; the title retains the historical U.S. EST label. This report records work through HEAD 1d4ac8b plus the refreshed project snapshot generated during this documentation pass.

Source Materials Reviewed

- Reviewed all 29 pre-existing Cinerific worklog PDFs at the repository root, spanning July 12 through the first September 29 report, including every same-day Part 1 and Part 2 artifact.
- Extracted the full PDF corpus with pdftotext, checked every document with pdftinfo, indexed recurring headings across the archive, and compared representative early, middle, and latest logs in detail.
- Confirmed that every prior Cinerific worklog uses four U.S.-Letter pages and that the latest convention uses Helvetica, PDF 1.4, extractable text, a repeated page title, a right-aligned footer, and OpenAI Codex authoring metadata.
- Read the first September 29 worklog as the direct baseline so this Part 2 report covers only the later genre-navigation and Settings sessions instead of repeating the authentication, Favorites analytics, device tracking, and initial phone Settings adaptation already documented.
- Reviewed commits c55b7a2, Standardized Movies and Shows genre navigation sizing, and 1d4ac8b, Refined phone-portrait Settings layout and profile controls, together with their full source diffs and commit statistics.
- Reviewed CinerificViewportGenreNav.kt, CinerificDestinationScreen.kt, CinerificTextFonts.kt, the profile-name PNG resources, .vscode/settings.json, the refreshed project snapshot, and the current clean Git state on main tracking origin/main.
- Used live screenshots, Android resource measurements, Gradle output, adb installation results, and repeated launches on the connected Samsung SM-G990U handset to distinguish layout-box geometry from visible artwork bounds.

Baseline Status Before September 29 Part 2 Work

- The first September 29 pass had created a dedicated portrait-phone Settings branch, but its compact signed-in card still showed Signed in as, a 64dp avatar, a small profile-name image, and a detached Sign out control.
- The account card scrolled with the rest of Settings, its translucent fill matched the other sections, and its layout had not yet been tuned around the visible transparent margins inside the Broadway username assets.
- Movies and Shows used responsive genre navigation, but the lettered genre buttons remained smaller than the All Genres control and left comparatively loose gaps inside the accepted overall navigation footprint.
- Phone Settings section cards retained a left outer margin and rounded left corners. The profile card, section headers, and section bodies therefore did not yet form the requested flush-left visual edge.
- OFF-state toggle knobs remained at 47 design units while ON-state knobs used 61, and the larger requested OFF appearance had not yet been applied or explicitly anchored to the track's vertical center.

Main Goals for September 29 Part 2

- Make every lettered genre control match the All Genres button scale while preserving the navigation's total width and height across devices and orientations.
- Recompose the portrait-phone Settings identity card around a large avatar, correctly scaled Broadway username, accessible sign-out control, and balanced visual spacing.
- Keep the complete identity card and its banner gap sticky during vertical scrolling, then refine the surrounding card and header edges without changing tablet or landscape layouts.
- Validate each narrow visual revision through clean builds and repeated deployment to the physical USB handset.

Cinerific Android App Work Log - September 29, 2026 Part 2 (U.S. EST)

Work Completed - Genre Navigation Standardization

- Resized every lettered genre button in the shared Movies and Shows viewport navigation to match the dimensions of the top-left All Genres button instead of preserving a visibly smaller secondary tier.
- Increased the apparent genre typography together with the boxes, satisfying the request to enlarge the complete controls rather than merely thickening their borders.
- Recalculated horizontal and vertical gaps around the enlarged genre buttons so the controls remain inside the previously accepted navigation width and height.
- Kept the responsive implementation shared across phone, tablet, portrait, and landscape branches, preventing a correction on one viewport from leaving the tablet emulator unchanged.
- Preserved the All Genres control as the sizing reference, the existing selection behavior, the navigation's outer placement, and the surrounding destination-screen composition.
- Built and rebooted the tablet/runtime context after the initial visual report, then committed the final shared geometry in c55b7a2.

Work Completed - Portrait Settings Identity Card

- Doubled the phone-portrait avatar from 64dp to 128dp while leaving the accepted tablet signed-in column on its existing scale and coordinate system.
- Replaced the small adjacent username treatment with the same Broadway-rendered PNG artwork used by Welcome and Create My Account, preserving each profile's intended canvas proportions.
- Removed the Signed in as label and its dedicated follow-on spacing so the identity content begins directly at the card's normal top padding without an empty placeholder region.
- Moved the username from beneath the avatar into a right-side vertical stack above the gray Sign out button, keeping the avatar as the left-side visual anchor.
- Distributed the avatar and right-side stack evenly across the available card width instead of relying on a weighted spacer that left unequal edge distances.
- Kept the avatar's requested 3dp downward visual nudge as an image-only offset so its layout footprint, the username position, and the card dimensions remained stable.
- Set the right-side stack to the same 128dp inner height as the avatar and refined its visible position by eye, accounting for the transparent padding inside the rendered image assets.
- Shifted the username artwork down a cumulative 9dp toward the Sign out button without changing the stack's measured size or moving other elements.

Work Completed - Visible Broadway Username Calibration

- Diagnosed the failed first width match: assigning the PNG canvas the button width made the visible letters much smaller because the files contain substantial transparent margins on both sides.
- Measured the alpha bounds of Steve, Martin, Janny, and Guest directly from their PNG resources rather than assuming that canvas dimensions represented visible lettering.
- Recorded visible-width fractions of 418/880 for Steve, 505/880 for Martin, 414/880 for Janny, and 422/800 for Guest, while retaining the 880x288 or 800x288 canvas aspect ratios.
- Derived a profile-specific canvas width from the rendered gray Sign out button width divided by each visible-width fraction. The visible Broadway letters now span the button width consistently without distortion.
- Used required width inside the fixed sign-out column so the transparent canvas can extend beyond that column while the visible lettering stays centered directly above the button.
- Preserved ContentScale.Fit and the native image aspect ratios, avoiding the stretched Broadway appearance seen during earlier username experiments.

Cinerific Android App Work Log - September 29, 2026 Part 2 (U.S. EST)

Work Completed - Sticky Profile Card

- Added a scroll-linked offset and elevated z-order to the complete portrait-phone identity card so the avatar, username, and Sign out control remain together above the scrolling Settings sections.
- Initially allowed the 36dp lead-in gap to collapse before the card pinned beneath the Settings banner, then revised the calculation after user review so the gap itself participates in the sticky behavior.
- The final behavior offsets the card by the current scroll value, preserving the full vertical breathing room beneath the fixed Settings banner throughout scrolling.
- Kept the sticky implementation inside the portrait-phone branch. Portrait tablets, landscape layouts, and the existing detached tablet account column retain their previous behavior.
- Raised the card's black fill from 14 percent through several visual comparison steps to a final 84 percent opacity, improving separation from content that scrolls beneath the sticky surface.

Work Completed - Flush-Left Settings Geometry

- Removed the phone-portrait content column's left outer padding so the identity card and the Accessibility, Playback, Billing & Payment, and Security parent boxes now reach the screen's left edge.
- Preserved the existing right margin and each card's internal row padding, so controls and explanatory copy did not become cramped when the parent surfaces expanded leftward.
- Restored the gray section-header label position after the parent boxes moved. Reduced only the negative header bleed while retaining the original internal start padding.
- Squared the top-left and bottom-left corners of every gray section-header pill while keeping both right corners rounded.
- Squared the left edge of the identity card and all phone Settings section bodies, retaining rounded top-right and bottom-right corners for the established trailing-edge treatment.
- Left the Settings banner title alignment unchanged, separating the requested card-edge revision from global screen chrome.

Work Completed - Toggle and Sign-Out Refinements

- Increased only the OFF-state switch knob endpoint by exactly five percent, from 47 to 49.35 design units. The ON-state endpoint remains 61 and therefore remains visibly larger.
- Preserved the existing horizontal travel, MediumBouncy damping ratio, Medium spring stiffness, color tweens, interaction behavior, timing, and bounce/jiggle character.
- Made the knob's CenterStart alignment explicit in addition to the track's centered content alignment, keeping both animated sizes vertically centered throughout the spring.
- Changed the Sign out label request from Bold to Black weight, then traced the lack of visual difference to CinerificTextFonts.kt, where Normal through Black all map to the same manrope.ttf outlines.
- Deferred a synthetic thickening effect or new font asset after documenting the cause, avoiding an unrelated font-system change during the layout pass.

Work Completed - Runtime Iteration and Workspace Detail

- Built, installed, force-stopped, and relaunched the debug application on USB device R5CRC33MGNZ after each accepted revision so the handset consistently reflected the current source.
- Captured live screenshots during spacing work and used the visible avatar, Broadway letters, gray button, and parent-card edges as the basis for later visual offsets rather than trusting layout bounds alone.
- Updated the VS Code inactive status-bar background to the established workspace accent color, keeping the editor chrome consistent with the active Peacock theme.

Cinerific Android App Work Log - September 29, 2026 Part 2 (U.S. EST)

Validation and Checks Performed

- Verified Eastern time independently as Tuesday, September 29, 2026 at 10:30 PM EDT, UTC-04:00, before selecting the same-day Part 2 filename.
- Ran `./gradlew :app:assembleDebug` throughout the implementation pass. Each final revision compiled successfully under the existing Gradle 8.7 project configuration.
- Ran `git diff --check` before deployment sequences to detect whitespace errors; no blocking diff-format issues were reported.
- Installed `app/build/outputs/apk/debug/app-debug.apk` with `adb -s R5CRC33MGNZ install -r` and received Success after the accepted genre-navigation and Settings changes.
- Force-stopped and relaunched `com.prahlincinerific.MainActivity` after installation so visual review used the rebuilt package rather than a stale process.
- Measured the profile-name PNG canvas sizes and nontransparent alpha bounds to verify the visible-width compensation used by the Settings username artwork.
- Reviewed the final commit range from the first September 29 worklog through `c55b7a2` and `1d4ac8b`, then confirmed main matched origin/main with a clean tree before refreshing the snapshot.
- Ran `read_project.sh` immediately before worklog generation. The refreshed `cinerific_PROJECT_SNAPSHOT.txt` now records the current repository tree, selected sources, tooling, and binary inventory.
- Validated this PDF with `pdftinfo` and `pdftotext` after generation, including page count, U.S.-Letter geometry, PDF version, metadata, extractable text, section ordering, and footer presence.

Files Touched During September 29 Part 2

- `app/src/main/java/com/prahlin/cinerific/ui/CinerificViewportGenreNav.kt` - standardized genre-button dimensions, typography scale, and internal gaps without expanding the navigation footprint.
- `app/src/main/java/com/prahlin/cinerific/ui/CinerificDestinationScreen.kt` - refined the phone Settings identity card, Broadway name measurement, sticky positioning, section geometry, toggle knob, and sign-out label weight.
- `.vscode/settings.json` - added the inactive status-bar background color used by the workspace theme.
- `cinerific_PROJECT_SNAPSHOT.txt` - refreshed the generated project snapshot for the current handoff.
- `cinerific_worklog_september 29 part 2.pdf` - added this second September 29 session artifact at the repository root.

Follow-Up Context

- The accepted phone profile card is now deliberately dense and high-contrast: 84 percent black, flush-left, square on the left, rounded on the right, and sticky with its full banner gap preserved.
- Future Settings changes should continue to remain inside the portrait-phone branch unless the user explicitly requests tablet or landscape parity; those layouts were intentionally protected during this pass.
- The Broadway username calculation depends on the measured alpha bounds of the current four PNGs. Replacing an asset requires updating its visible-width fraction or trimming the replacement file.
- A genuinely heavier Sign out label requires a distinct heavier Manrope font file or a deliberate rendering effect because all declared weights currently reference one physical font resource.
- The current genre navigation should retain its accepted outer bounds. Additional chip growth must be paid for by gap changes or a deliberate request to enlarge the navigation container.
- The connected physical device remains the primary phone-portrait reference; the Standard tablet emulator remains the regression target for shared and non-phone layouts.

Output Artifact

- Created `/Users/prahlin/gh/cinerific/cinerific_worklog_september 29 part 2.pdf` using the established lowercase filename, month/day spacing, and same-day Part 2 suffix.
- Kept the established four-page U.S.-Letter structure, Helvetica typography, compact technical density, repeated title, right-aligned footer, PDF 1.4 compatibility, and extractable text.
- Scoped the report to work completed after the first September 29 artifact and recorded the final accepted values rather than every discarded intermediate experiment.
- No source commit was created by the PDF-generation step; the new worklog and mechanically refreshed snapshot remain available for review and the next repository commit.
