

Cinerific Android App Work Log - July 15, 2026 Part 1

Compiled summary for Wednesday, July 15, 2026 - Part 1 - focus: creating a Cinerific project snapshot scanner from the Alla Vostra read_project.sh convention, documenting which files future AI sessions should include or ignore, restoring upgraded Figma access, importing the Home & Default screen from the Cinerific Figma file, cropping real home artwork into Android drawable resources, scaffolding the native Compose home screen, wiring the intro into the new home/default surface, building and installing the app on the tablet AVD, and reopening the Android Studio runtime workflow.

Generated in continuity with the established Cinerific worklog cadence from July 12 and July 14: compact opening summary, source-material review, baseline state, goals, work-completed sections, validation, files touched, follow-up context, and output-artifact close. This artifact records only Cinerific work from the July 15 Part 1 Codex session, while using the prior Cinerific and Alla Vostra logs as naming, structure, length, and tone references.

Source Materials Reviewed

- Reviewed the existing Cinerific worklog artifacts at the repository root: cinerific_worklog_july 12.pdf and cinerific_worklog_july 14.pdf. The July 12 artifact established the Cinerific naming convention and first Figma-to-Android import narrative; the July 14 artifact established the continuous intro-animation implementation and the four-page daily-log shape.
- Re-read the Cinerific commit history on main, especially July 15 commits 6483130 and c926fca, to keep this worklog aligned with actual source-control history rather than only chat memory.
- Studied /Users/prahlin/gh/alla_vostra/read_project.sh as the model for a root-level project scanner: instruction header, command abbreviations, project tree, numbered file dumps, generated/cache exclusions, and a clear not-included section.
- Reviewed /Users/prahlin/gh/cinerific source files and resources, including read_project.sh, cinerific_PROJECT_SNAPSHOT.txt, CinerificApp.kt, CinerificHomeScreen.kt, CinerificIntroView.kt, drawable-nodpi assets, Gradle files, and VS Code/Android Studio task files.
- Used the Figma connector against file key qbpfnwBirp0WoOHSqw1TN. Queried Page 1, the Home & Default section 485:7119, the full Display - Home & Default frame 101:613, and the focused tablet frame 813:7630.
- Reviewed Figma screenshots and metadata for the Home & Default design: a hero/header area, Cinerific logo, menu icon, dark purple-black background, and horizontally scrolling program rows for Crime, Thriller, Comedy, Action, Drama, Documentary, and Horror.
- Used git status, git log, git show --stat, rg, pdftotext, pdfinfo, Gradle build output, adb device state, emulator screenshots, and Android Studio/AVD runtime checks. No external PDF dependency was installed for this worklog.

Baseline Status Before July 15 Part 1

- The repository already had the July 14 native Android intro renderer, real Cinerific intro artwork, avatar/name assets, splash fixes, and a boot animation that settled into the Cinerific logo plus four profile icons.
- The app still lacked an implemented Home & Default screen. The prior July 14 worklog explicitly identified Home & Default as the next screen to scaffold once the Figma quota/plan situation allowed fresh extraction.
- The Android project did not yet have a reusable Cinerific snapshot file. Future AI/Codex sessions had to rediscover which files mattered and which generated, local, private, or binary files should be ignored.
- Figma plan limits had previously constrained live design access. At the start of this Part 1 pass, the user had upgraded to Figma Pro and asked to import the default/home screen from the real Cinerific Figma file.
- Android Studio and the Cinerific_Standard_Tablet AVD were part of the working loop, but the user specifically wanted the running app visible through the Android Studio in-window device experience rather than only through detached terminal-driven adb commands.

Main Goals for July 15 Part 1

- Create a Cinerific equivalent of Alla Vostra read_project.sh so future sessions can scan the project consistently and understand the ignore policy each time the script runs.
- Import the Figma Home & Default screen into the Android app as a real native scaffold rather than a single unexplained placeholder or a live Figma expectation inside Android Studio.
- Preserve visible Cinerific design material from the Figma file: hero art, dark background, row headers, chevrons, rounded program cards, and the home program categories.
- Wire the existing boot intro into the new home/default destination so the app no longer ends only on the intro final state.
- Build, install, launch, and screenshot-check the app on the Cinerific tablet AVD after the

home/default import.

- Produce this July 15 Part 1 worklog using the established Cinerific PDF convention.

Work Completed - Project Snapshot Scanner

- Studied the Alla Vostra read_project.sh structure and created a Cinerific-specific root-level read_project.sh.
- Implemented cinerific_PROJECT_SNAPSHOT.txt generation so the script rebuilds the snapshot from the current workspace every time it runs.
- Adapted the instruction header and command abbreviation dictionary from the Alla Vostra convention while changing the file lists and headings for the Android/Kotlin Cinerific project.
- Added a SNAPSHOT IGNORE POLICY section so future AI sessions can see which files were deliberately omitted rather than assuming the project tree is incomplete by accident.
- Excluded generated/cache/runtime/private/noisy paths from the scan: .git, .gradle, .idea, app/build, build, .kotlin, .tmp, .cache, .DS_Store, local.properties, *_PROJECT_SNAPSHOT.txt, *.jks, and *.keystore.
- Preserved binary image and screenshot awareness without dumping raw image/PDF bytes. The snapshot inventories binary assets by path, size, and modified time instead of embedding them as unreadable text.
- Validated the script with bash -n and by running ./read_project.sh. The project snapshot was later committed in the July 15 home-import commit after the screen assets were added.

Work Completed - Figma Home & Default Extraction

- Reconnected to the Cinerific Figma design file through the available connector after the user upgraded Figma access.
- Listed the Figma document pages and found a single Page 1. Queried the page structure and identified Home & Default section 485:7119.
- Ran a targeted Figma query for candidate Home/Default frames and located Display - Home & Default nodes, including full scroll frame 101:613 and focused tablet frame 813:7630.
- Captured Figma screenshots for the focused tablet viewport and the long scroll home stack. The focused view showed program rows and cropped cards; the long view revealed the hero/header plus Crime, Thriller, Comedy, Action, Drama, Documentary, and Horror rows.
- Downloaded a full-resolution Figma render of the Home & Default stack and used it as the source for exact crop coordinates instead of manually redrawing the card artwork.
- Generated cropped Android drawable resources for the hero/header and program cards. The final imported set contains 34 home_*.png files under app/src/main/res/drawable-nodpi.
- Removed an unused intermediate home_hero.png crop after replacing it with the taller home_hero_header.png asset that better matched the Figma scroll stack.

Work Completed - Home Screen Scaffold

- Added app/src/main/java/com/prahlin/cinerific/ui/CinerificHomeScreen.kt as the native Compose scaffold for the Figma Home & Default screen.
- Built the screen as a scrollable dark Cinerific surface with a Figma-derived hero/header image and program rows using actual cropped artwork assets.
- Defined HomeProgramRows for Crime, Thriller, Comedy, Action, Drama, Documentary, and Horror, with each row backed by drawable resource IDs for the imported card art.
- Implemented horizontal scrolling rows, row titles, right-chevron affordances, rounded corners, shadows, stable card aspect ratios, and responsive sizing from the 1194-pixel Figma frame width.
- Updated CinerificApp.kt so the existing intro animation remains first, then switches to CinerificHomeScreen after BOOT_ANIMATION_MS using Compose state and a coroutine delay.
- Kept the home screen as a scaffold rather than a final product surface: the current pass focuses on real art, structure, and bootability, while full navigation, interactions, and detailed component behavior remain future work.
- Noted that tap-to-skip or tap-to-navigate from the intro was requested later, but that implementation was interrupted before completion. The committed July 15 Part 1 behavior is timed intro handoff into Home & Default.

Work Completed - Android Studio and AVD Runtime

- Built the updated app with Gradle after importing the home/default assets and code. The drawable resource names resolved correctly through Android generated R resources.
- Installed the debug APK onto Cinerific_Standard_Tablet and launched com.prahlincinerific.MainActivity through adb.
- Captured post-intro emulator screenshots confirming that the Home & Default hero/header screen appears after the intro handoff.
- Scrolled the running app and captured row-area screenshots confirming that the program-card rows render with the imported Figma artwork below the hero/header.
- Opened Android Studio with the Cinerific project and worked to bring the tablet AVD into the

Running Devices/in-window flow.

- Confirmed the AVD name through adb emu avd name and verified that com.prahlincinerific was running on emulator-5554.
- Attempted macOS UI automation to open Android Studio Running Devices, but System Events was blocked by macOS Apple Events authorization. The AVD and app were still booted and verified through adb/screenshots.

Validation and Checks Performed

- Ran `bash -n read_project.sh` after creating the Cinerific project scanner.
- Ran `./read_project.sh` repeatedly after scanner edits and after the home/default import so `cinerific_PROJECT_SNAPSHOT.txt` reflected the current project state.
- Ran `./gradlew :app:assembleDebug` after the Home & Default scaffold and asset import. The build completed successfully.
- Ran `./gradlew :app:installDebug` and launched `com.prahlincinerific.MainActivity` on `Cinerific_Standard_Tablet`.
- Used adb screenshots to verify the running app at the top of the imported home/default hero and after scrolling into the program row area.
- Confirmed the committed July 15 source history: 6483130 for `read_project.sh` and c926fca for Home & Default import, home assets, Compose scaffold, and refreshed project snapshot.
- Confirmed that current local working tree status before this PDF included unrelated local configuration changes in `.gitignore/.vscode` files. This worklog generation does not rely on those local config edits.

Files Touched During July 15 Part 1

- `read_project.sh`: Cinerific root-level snapshot generator modeled after the Alla Vostra scanner, with Cinerific-specific source lists and ignore policy.
- `cinerific_PROJECT_SNAPSHOT.txt`: generated project snapshot used to help future AI/Codex sessions understand the current Cinerific source tree and binary asset inventory.
- `app/src/main/java/com/prahlin/cinerific/ui/CinerificApp.kt`: updated to hand off from the native intro renderer into `CinerificHomeScreen` after the boot animation duration.
- `app/src/main/java/com/prahlin/cinerific/ui/CinerificHomeScreen.kt`: new native Compose implementation of the Figma Home & Default scaffold.
- `app/src/main/res/drawable-nodpi/home_hero_header.png`: Figma-derived hero/header crop for the Home & Default screen.
- `app/src/main/res/drawable-nodpi/home_crime_*.png`, `home_thriller_*.png`, `home_comedy_*.png`, `home_action_*.png`, `home_drama_*.png`, `home_documentary_*.png`, and `home_horror_*.png`: cropped program-card artwork from the Figma Home & Default stack.
- `cinerific_worklog_july 15 part 1.pdf`: this worklog artifact generated at the repository root.

Follow-Up Context

- Add tap-to-skip or tap-to-navigate behavior for the intro screen if the desired interaction is that any tap moves immediately to Home & Default instead of waiting for the timed handoff.
- Replace cropped composite card images with more structured reusable card components later if the app needs dynamic titles, metadata, focus states, hover/remote control behavior, or accessibility text.
- Implement the right-side navigation rail from the Figma file as a live Android component instead of relying on the static hero/menu crop.
- Add click handling for row chevrons and horizontal program cards so Home & Default becomes a navigable application surface rather than a visual scaffold.
- Continue importing screens deliberately from Figma one screen or component group at a time, using the project snapshot and targeted Figma node IDs to avoid broad MCP/dev-call waste.
- Revisit Android Studio embedded emulator behavior if needed. The Running Devices tool window is registered and visible in Studio workspace state, but macOS automation permissions prevented Codex from clicking the IDE UI directly.

Output Artifact

- Filename: `cinerific_worklog_july 15 part 1.pdf`
- Created at the repository root in `/Users/prahlin/gh/cinerific`.
- Follows the Cinerific filename convention established by `cinerific_worklog_july 12.pdf` and `cinerific_worklog_july 14.pdf`, including the space before the day number and the lowercase part label.
- Follows the established Alla Vostra/Prahlincinerific daily worklog structure while keeping the body content specific to Cinerific work.
- No external PDF dependency was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior Cinerific worklogs.

- Created this daily worklog PDF: cinerific_worklog_july 15 part 1.pdf.
