

Cinerific Android App Work Log - July 15, 2026

Compiled summary for Wednesday, July 15, 2026 - focus: reducing VS Code/Codex reconnect churn after the Home & Default import, documenting that the Gradle/build ignore fix was already working, converting the intro handoff from a timed delay into an avatar-driven entry point, adding a live right-side navigation rail, scaffolding Movies, Shows, Favorites, and Settings surfaces, adding a looping Home hero reel, and hardening the video playback lifecycle after diagnosing the hero video as the likely runtime reconnect/restart source.

Generated in continuity with the established Cinerific worklog cadence from July 12, July 14, and July 15 Part 1: compact opening summary, source-material review, baseline, goals, work-completed sections, validation, files touched, follow-up context, and output-artifact close. This artifact records Cinerific work from the July 15 pass and uses the prior Cinerific and Alla Vostra PDFs as naming, structure, length, and tone references.

Source Materials Reviewed

- Reviewed cinerific_worklog_july 12.pdf, cinerific_worklog_july 14.pdf, and cinerific_worklog_july 15 part 1.pdf. That prior July 15 artifact established the Home & Default baseline for this worklog.
- Reviewed July 15 Git history on main: 6483130 for read_project.sh, c926fca for the Home & Default Figma import, and 0f6d2da for the VS Code workspace/MCP cleanup intended to improve reconnect behavior.
- Reviewed current working tree status and diffs for CinerificApp.kt, CinerificHomeScreen.kt, CinerificIntroView.kt, cinerific_PROJECT_SNAPSHOT.txt, and the new untracked UI files CinerificDestinationScreen.kt and CinerificRightSideNavBar.kt.
- Reviewed the new raw media asset app/src/main/res/raw/home_hero_reel.mp4, identified locally as an ISO Media MP4 file at 5,972,765 bytes.
- Reviewed .gitignore, .vscode/settings.json, and .vscode/mcp.json after the reconnect cleanup commit. The workspace now excludes Android build/cache noise and keeps the local figmaDesktop MCP endpoint.
- Used git status, git log, git show --stat, git diff, git check-ignore, rg, ls/find/stat/file inspection, pdftotext/pdftinfo, adb device checks, and Gradle assembleDebug output. No external PDF dependency was installed for this worklog.

Baseline Status Before July 15

- Cinerific already had the July 14 native boot intro renderer and, from July 15 Part 1, a bootable Home & Default Compose scaffold using Figma-cropped hero and program-card assets.
- The Part 1 app still handed off automatically after BOOT_ANIMATION_MS. The next desired interaction was for a settled avatar tap to enter the app deliberately.
- Home still used a static hero/header crop, and there was no live navigation beyond the Home scaffold. Movies, Shows, Favorites, and Settings were expected product destinations but not yet reachable native screens.
- The user had already fixed the Gradle/build ignore problem. The remaining reconnect symptom therefore needed to be separated into editor/project-watch churn versus runtime lifecycle churn.
- No Android emulator or phone was attached through adb during the final reconnect diagnosis, so logcat could not be captured. Source inspection and build validation were used for this pass.

Main Goals for July 15

- Reduce avoidable editor/Codex reconnect churn by excluding local build/cache output and simplifying workspace MCP configuration.
- Replace the automatic intro timer handoff with an avatar-selection handoff into the main Cinerific experience.
- Add a right-side navigation rail with Home, Movies, Shows, Favorites, and Settings destinations.
- Scaffold destination screens enough that the rail connects to actual Android surfaces instead of a decorative overlay.

- Replace the static Home hero crop with a looping raw MP4 hero reel and harden its MediaPlayer lifecycle after diagnosing reconnect-like playback behavior.
- Build the app after the lifecycle fix and record the remaining source-control state for review.

Work Completed - Workspace and Reconnect Cleanup

- Committed 0f6d2da to optimize the VS Code workspace for faster Codex reconnects and simpler MCP setup.
- Added .vscode/settings.json with watcher/search exclusions for .gradle, .idea, app/build, and build so VS Code does not index generated Android output.
- Simplified .vscode/mcp.json from multiple Figma/MCP server entries to only the local figmaDesktop HTTP endpoint at <http://127.0.0.1:3845/mcp>.
- Expanded .gitignore with cinerific_PROJECT_SNAPSHOT.txt, screenshots/, and cinerific_worklog_*.pdf to keep generated snapshots, screenshots, and worklog artifacts out of future default status noise.
- Verified the ignore rules with git check-ignore for .gradle, app/build, .idea, local.properties, and the July 15 Part 1 worklog PDF.
- Identified that already tracked files, including cinerific_PROJECT_SNAPSHOT.txt and older screenshot/worklog artifacts, can still appear modified until removed from the Git index. That Git behavior is separate from reconnecting.

Work Completed - Intro and App Flow

- Updated CinerificIntroView.kt with MotionEvent handling so a final avatar press only completes when the touch starts and ends on a settled avatar.
- Added FINAL_AVATAR_BOUNDS for Steve, Martin, Janny, and Guest in the same 1194 by 834 Figma coordinate space as the intro renderer.
- Added onAvatarSelected as the bridge from the native intro View back into Compose, and made the view clickable/focusable for Android interaction semantics.
- Guarded avatar hit testing so taps before the final settled frame do not skip into the app prematurely.
- Updated CinerificApp.kt to remove the automatic coroutine delay handoff, add CinerificDestination, and introduce CinerificMainExperience as the post-intro destination state holder.
- Routed the intro into the main app only when CinerificIntroView invokes onAvatarSelected.

Work Completed - Navigation and Destination Screens

- Added CinerificRightSideNavBar.kt as a right-edge Compose navigation rail with Home, Movies, Shows, Favorites, and Settings entries.
- Implemented compact and expanded rail states with animateFloatAsState, a 150 ms ease-out animation, a menu icon, selected/inactive styling, and a Home auto-collapse delay.
- Added CinerificDestinationScreen.kt with reachable surfaces for Movies, Shows, Favorites, and Settings.
- Built Movies, Shows, and Favorites as catalog-style gradient screens using existing imported Home card artwork in horizontal rows, avoiding another broad Figma import for this pass.
- Built Settings as a Cinerific-styled scroll screen with Accessibility, Playback, Billing & Payment, and Security sections plus simple toggle pills.
- Routed destination selection through CinerificMainExperience so the nav rail overlays Home and each destination surface.

Work Completed - Home Hero Reel and Runtime Diagnosis

- Added app/src/main/res/raw/home_hero_reel.mp4 as the local looping hero source. Its 5.7 MB size is not large enough by itself to explain project-level reconnect churn.
- Updated CinerificHomeScreen.kt to replace the static home_hero_header image with HomeHeroHeader, which layers a looping video reel behind the Cinerific logo.
- Adjusted Home layout details while adding the reel: 1194 by 834 hero aspect, 80 percent card

scale, larger row gaps, and bottom spacing that accounts for navigation bars.

- Diagnosed the remaining reconnect-like symptom as runtime lifecycle churn rather than a Gradle/build-file issue. The app has no networking stack, and assembleDebug was already passing.
- Replaced the original SurfaceView-style player path with a TextureView-backed player and a Matrix center-crop transform so playback does not resize the surface view during layout.
- Hardened MediaPlayer cleanup by releasing stale players before starting new ones, clearing listeners on release, ignoring late prepared callbacks from released players, and releasing the Surface when the texture is destroyed or the view detaches.

Validation and Checks Performed

- Ran ./gradlew assembleDebug after the Home video lifecycle fix; the debug build completed successfully.
- Ran adb devices -l during diagnosis. No device or emulator was attached, so no live logcat capture or final on-device visual verification was possible.
- Ran git status --short and git diff --stat. Active modified files are CinerificApp.kt, CinerificHomeScreen.kt, CinerificIntroView.kt, and cinerific_PROJECT_SNAPSHOT.txt; new untracked paths are CinerificDestinationScreen.kt, CinerificRightSideNavBar.kt, and app/src/main/res/raw/.
- Ran git show --stat for 0fd2da, c926fca, and 6483130 so committed July 15 work is separated from active uncommitted implementation work.
- Ran file/stat inspection on home_hero_reel.mp4 and confirmed it is an MP4 resource at 5,972,765 bytes.
- Used pdftotext and pdfinfo on prior Cinerific PDFs before writing this artifact, preserving the four-page letter-size style and root-level naming convention.

Files Touched During July 15

- .gitignore: now ignores cinerific_PROJECT_SNAPSHOT.txt, screenshots/, and cinerific_worklog_*.pdf in addition to Android/editor/build output.
- .vscode/settings.json: new watcher/search exclusions for .gradle, .idea, app/build, and build.
- .vscode/mcp.json: simplified to the local figmaDesktop MCP server only.
- app/src/main/java/com/prahlin/cinerific/ui/CinerificApp.kt: removes timed intro handoff, adds CinerificDestination, creates CinerificMainExperience, routes destination state, and overlays the right-side navigation rail.
- app/src/main/java/com/prahlin/cinerific/ui/CinerificIntroView.kt: adds final-avatar hit

testing and onAvatarSelected callback for entering the main app from the settled intro.

- app/src/main/java/com/prahlin/cinerific/ui/CinerificHomeScreen.kt: replaces the static hero crop with a TextureView/MediaPlayer looping hero reel, keeps logo overlay, adjusts layout scale/spacing, and guards video lifecycle cleanup.
- app/src/main/java/com/prahlin/cinerific/ui/CinerificRightSideNavBar.kt: new right-side navigation rail with destination callbacks and collapse/open behavior.
- app/src/main/java/com/prahlin/cinerific/ui/CinerificDestinationScreen.kt: new scaffold screens for Movies, Shows, Favorites, and Settings.
- app/src/main/res/raw/home_hero_reel.mp4: new local looping Home hero video source.
- cinerific_PROJECT_SNAPSHOT.txt: regenerated after workspace/MCP ignore changes and still tracked, so Git can report it modified despite the new ignore rule.
- cinerific_worklog_july 15.pdf: this generated worklog artifact at the repository root.

Follow-Up Context

- Attach or start the Cinerific tablet AVD before the next runtime pass so logcat can confirm whether the hero reel lifecycle fix removes the observed reconnect/restart behavior on device.
- Decide whether generated worklogs, screenshots, and cinerific_PROJECT_SNAPSHOT.txt should

remain tracked historical artifacts or be removed from the Git index now that ignore rules exclude them.

- Consider Media3/ExoPlayer later if playback controls, lifecycle ownership, or broader media diagnostics become important.
- Replace the scaffolded destination layouts with real Figma-derived screens when Movies, Shows, Favorites, and Settings move beyond placeholder catalog/settings surfaces.
- Add accessibility labels and real click behavior for program cards, row chevrons, nav items, and settings toggles once the visual navigation path is accepted.
- Re-run read_project.sh after the current uncommitted source files and raw media asset are accepted so the snapshot reflects the final July 15 source state.

Output Artifact

- Filename: cinerific_worklog_july 15.pdf
- Created at the repository root in /Users/prahlin/gh/cinerific.
- Follows the standard Cinerific July worklog filename convention, including the space before the day number.
- Follows the established Alla Vostra/Prahlín daily worklog structure while keeping the body content specific to Cinerific work.
- No external PDF dependency was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior Cinerific worklogs.
- Created this daily worklog PDF: cinerific_worklog_july 15.pdf.
