

Cinerific Android App Work Log - August 4, 2026 (U.S. EST)

Compiled summary for Tuesday, August 4, 2026 (U.S. EST) - focus: continuing the post August 3 auth preview polish pass by reviewing the current project snapshot and all prior Cinerific worklogs, booting and using the Cinerific Standard Tablet AVD, iterating the Forgot Username/Password layout through left aligned descriptive copy, 60/40 horizontal redistribution, protected outer margins, wider internal stack spacing, evenly spaced recovery controls, and doubled Username/Password selector padding, then fixing a returning orientation bug so rotation no longer navigates away from active Sign In, Create Account, or Forgot Username/Password preview states.

Generated in continuity with the established Cinerific worklog cadence from July 12, July 14, July 15 Part 1, July 15, July 16, July 18, July 19, July 20, July 22, July 23, July 24, July 25, July 27, July 28 Part 1, July 28 Part 2, July 29, August 1, and August 3: compact opening summary, source material review, baseline state, goals, themed work completed sections, validation, files touched, follow up context, and output artifact close.

No August 4 Part 1 PDF existed in the repository, so this artifact follows the no part filename convention for the first August 4 worklog. It records the current source state on main through HEAD 437405c, Preserved intro flow state across rotation, plus the refreshed snapshot and generated worklog artifact from this August 4 documentation pass.

Source Materials Reviewed

- Reviewed every pre-existing Cinerific worklog PDF at the repository root: July 12, July 14, July 15 Part 1, July 15, July 16, July 18, July 19, July 20, July 22, July 23, July 24, July 25, July 27, July 28 Part 1, July 28 Part 2, July 29, August 1, and August 3.
- Converted the latest and earlier worklogs with pdftotext and inspected heading cadence, opening summary rhythm, section order, prose density, validation language, files touched style, follow up close, output artifact phrasing, and the U.S. EST title convention.
- Ran pdftinfo across the worklog PDFs to preserve the four page letter layout, title metadata, author/creator/producer pattern, PDF 1.4 output, footer convention, and Codex standard library PDF generator style.
- Reviewed cinerific_PROJECT_SNAPSHOT.txt for the current generated timestamp, file tree, worklog inventory, Android source dump, asset inventory, and read_project.sh snapshot convention.
- Reviewed git log, git show --stat, git show --name-status, and the diff from 26d9f0e to HEAD 437405c to identify the August 4 source changes that had been committed before this artifact pass.
- Reviewed app/src/main/AndroidManifest.xml, CinerificApp.kt, and CinerificIntroView.kt around configuration changes, Compose saveable state, AndroidView hosting, native intro snapshot restoration, Forgot layout constants, recovery selector layout, touch hit testing, and mock auth state changes.
- Reviewed runtime context from the pass: Cinerific Standard Tablet AVD launch/install activity, emulator screenshots for Forgot Username/Password and Sign In rotation behavior, adb rotation commands, Gradle compile/install output, and final git status before worklog generation.

Baseline Status Before August 4 Work

- Cinerific entered August 4 with the August 3 account prompt and recovery flow pass committed and logged: Create My Account and Forgot Username/Password prompt copy, centered slide in titles, dynamic Username/Password recovery copy, loading/sent states, chevron tuning, and the accepted right side Forgot form stack.
- The Forgot Username/Password screen still needed finer typographic alignment: the left explanatory paragraphs were not yet all left aligned, the Recover my: label needed to match the descriptive paragraph size, and the right side controls needed better horizontal distribution inside their column.
- The Forgot layout needed a formal 60 percent explanatory copy region and 40 percent form/control region while keeping the accepted copy left and controls right composition intact.
- The user requested additional horizontal spacing between the left paragraph stack and right form stack, but explicitly required protecting the outer screen margins from creeping inward or outward.
- The Username and Password recovery selector buttons still used the older fixed width, so their text to edge padding needed to be doubled while keeping the visual button bounds and tap bounds synchronized.
- A regression had returned where rotating between portrait and landscape during Sign In slide

ins could reset navigation back to the profile prompt or otherwise leave the active screen, violating the rule that rotation must resize the app without navigating elsewhere.

- The project had no August 4 root level PDF worklog before this pass.

Main Goals for August 4

- Apply the requested Forgot Username/Password copy alignment, label sizing, 60/40 horizontal split, protected margins, and selector button padding refinements without moving the accepted controls right form stack.
- Maintain the 40 percent selector row while spacing Recover my:, Username, and Password evenly and keeping the row within the usable Forgot form column.
- Make Username and Password selector buttons wider based on measured text so the apparent left/right padding doubled and the same width drove hit testing.
- Stop orientation changes from acting like navigation events anywhere in the app, especially during Sign In, Create Account, and Forgot Username/Password preview slide ins.
- Preserve active native intro/form state through rotation and rebuilt views, including current auth flow, field text, recovery target, Remember me state, dropdown selections, submit state, and Create Account avatar selection.
- Compile, install, rotate test, screenshot check, commit, refresh the project snapshot, and generate the latest root level PDF worklog artifact.

Work Completed - Project Orientation and Emulator Setup

- Ran read_project.sh at the start of the session, reviewed the generated Cinerific project snapshot, and read the prior worklog and snapshot context before continuing UI work.
- Confirmed the Cinerific Standard Tablet AVD was available as emulator-5554, installed the debug APK, and launched com.prahlincinerific.MainActivity for visual inspection.
- Kept the work scoped to the native auth preview surface and Activity/Compose host needed for rotation behavior; Home, catalog, Favorites, Settings, playback, and detail surfaces were intentionally left alone except for app wide rotation protection.
- Worked from the established custom View drawing model in CinerificIntroView.kt rather than introducing a new layout framework for the Forgot screen.
- Reused the existing Gradle, adb, screenshot, and project snapshot workflow used by the recent August 1 and August 3 passes.

Work Completed - Forgot Username/Password Layout Polish

- Left aligned the lefthand descriptive paragraphs while preserving the centered lead row No Sign-In Information? No problem. as the one exception requested by the user.
- Matched Recover my: font size to the larger bottom descriptive paragraphs so the selector label visually belongs to the current Forgot screen hierarchy.
- Reworked the Forgot horizontal region into a protected usable width with a 60 percent copy column and 40 percent form/control column.
- Doubled the internal stack gap between the paragraph column and button/form column only on Forgot Username/Password, while subtracting that gap from internal content width so the left and right outer screen margins remained protected.
- Kept the controls in the accepted right side stack and the explanatory copy in the left side stack throughout every spacing iteration.
- Updated the Forgot form width, field width, submit button width, helper copy width, and hit testing to use the new 40 percent column instead of the old fixed MOCK_FORM_WIDTH assumptions.
- Kept the Forgot prompt center calculation aligned with the protected usable width so the preview prompt and active title behavior stayed coherent after the layout redistribution.

Work Completed - Recovery Selector Row and Button Padding

- Redistributed the Recover my:, Username, and Password row evenly across the 40 percent Forgot form column.
- Replaced the older fixed selector row gap math with a helper that divided remaining horizontal space into even internal gaps while preserving the row width.
- Doubled Username and Password button text to edge padding by measuring the Username and Password labels, deriving the previous side padding from the old 90f button width, and expanding both option boxes from that measured baseline.
- Shared the computed selector button width between drawing and hit testing so taps follow the widened visual button bounds exactly.
- Verified in emulator screenshots that the widened Username/Password buttons fit cleanly in the 40 percent column, kept centered text, retained protected margins, and still switched

the active recovery target on tap.

- Preserved the existing selected and pressed translucent field styling, rounded corners, and text opacity language for both selector options.

Work Completed - Rotation Navigation Protection

- Added MainActivity configuration handling for keyboard, keyboardHidden, navigation, orientation, screenLayout, screenSize, and smallestScreenSize so ordinary orientation changes resize the existing Activity instead of forcing navigation through Activity recreation.
- Added a saveable CinerificIntroSnapshot in CinerificApp.kt using a compact listSaver so Compose can preserve native intro state across recomposition and Activity rebuild fallbacks.
- Added onIntroSnapshotChanged and restoreIntroSnapshot hooks to CinerificIntroView so the native custom View can publish and restore active auth preview state instead of losing it when AndroidView is recreated.
- Captured active flow, field text, recovery target, Forgot submission state, Remember me state, dropdown values, and Create Account avatar index in the snapshot.
- Reset transient press, drag, dropdown, focus, composing, and dim overlay state during restore so rotation revives stable navigation/form state without preserving an in flight touch gesture.
- Reset the intro snapshot only on intentional profile entry or sign out, so user navigation remains explicit while orientation remains a layout only event.
- Ensured user triggered chevron/back closing still intentionally returns to the profile prompt, while rotation alone cannot do that.

Work Completed - Validation, Snapshot, and Commit State

- Ran `./gradlew :app:compileDebugKotlin` after the selector button padding changes; Kotlin compilation succeeded.
- Installed the debug APK on the Cinerific Standard Tablet AVD and relaunched the app after UI changes that affected runtime layout and hit testing.
- Captured and visually inspected Forgot Username/Password screenshots after the doubled selector padding and confirmed Username selection changed the active state, input label, helper copy, and submit button text.
- Ran `./gradlew :app:assembleDebug` and `./gradlew :app:installDebug` after adding rotation protection and the intro snapshot saver.
- Reproduced the orientation issue during early testing, confirmed the Activity level `configChanges` alone was insufficient, and added the saveable native intro snapshot layer to cover rebuilt view fallbacks.
- Verified Sign In stayed open when rotating portrait to landscape, stayed open when rotating landscape to portrait, and stayed open after a mid slide portrait to landscape rotation once the sign in tap timing was isolated from raw emulator coordinate issues.
- Ran `git diff --check` and `./gradlew :app:compileDebugKotlin` before handoff; both completed successfully.
- Committed the source and snapshot work on main as HEAD 437405c, Preserved intro flow state across rotation.

Validation and Checks Performed

- Used `pdftotext` and `pdftinfo` on every prior root level Cinerific worklog PDF before generating this artifact, with closest comparison against August 1 and August 3.
- Ran `git status --short --branch`, `git log --oneline --decorate`, `git show --stat --summary HEAD`, `git show --name-status --format=fuller HEAD`, and `git diff 26d9f0e..437405c --stat` to confirm the committed source scope.
- Ran `rg` and `sed` inspections around MainActivity `configChanges`, CinerificIntroSnapshot, `restoreIntroSnapshot`, `onIntroSnapshotChanged`, CinerificIntroSnapshotSaver, Forgot layout constants, selector layout helpers, and snapshot notification calls.
- Ran `./gradlew :app:compileDebugKotlin` multiple times during the source pass and after the final worklog generation setup; the Kotlin build reported BUILD SUCCESSFUL.
- Ran `./gradlew :app:assembleDebug` and `./gradlew :app:installDebug` during runtime validation; `app-debug.apk` installed on Cinerific_Standard_Tablet.
- Used `adb shell` settings put `system_user_rotation`, `adb shell` input tap, `adb exec-out` `screencap`, `wm size`, `dumpsys activity`, and `dumpsys window` checks while validating rotation and foreground Activity state.
- Visually inspected the relevant screenshots in `/tmp`, including the Forgot widened selector state and the Sign In portrait/landscape rotation results.

- Generated this PDF with a small standard library PDF writer so the output remains text extractable and consistent with prior Cinerific worklogs.

Files Touched During August 4

- app/src/main/AndroidManifest.xml: MainActivity now handles orientation and screen size configuration changes so rotation does not recreate and navigate away from active app state.
- app/src/main/java/com/prahlin/cinerific/ui/CinerificApp.kt: added saveable intro snapshot state, a listSaver, AndroidView snapshot wiring, and snapshot resets on intentional profile entry/sign out.
- app/src/main/java/com/prahlin/cinerific/ui/CinerificIntroView.kt: Forgot 60/40 layout constants, protected internal stack gap, left aligned descriptive copy, Recover my: font sizing, evenly spaced selector layout, measured wider selector buttons, updated hit testing, native intro snapshot restore/publish behavior, and state notification calls.
- cinerific_PROJECT_SNAPSHOT.txt: refreshed generated project snapshot timestamp and source dump as part of the committed source pass and this artifact workflow.
- cinerific_worklog_august 4.pdf: new root level PDF worklog artifact for the August 4 pass, intentionally without a part suffix because no August 4 Part 1 PDF existed in the repository.

Follow-Up Context

- Rotation is now treated as a layout resize event, not a navigation event. Future auth preview changes should preserve that rule for Sign In, Create Account, Forgot Username/Password, and any new intro sub flow.
- The saveable intro snapshot intentionally restores stable UI state but clears transient press/drag/focus/composing details; that keeps rotation safe without freezing a half gesture.
- The Forgot Username/Password flow remains a native mock/prototype. Reminder/reset actions still represent visual states rather than backend account recovery calls.
- The accepted Forgot composition is copy on the left and controls on the right with protected outer margins, a wider internal gutter, 60/40 content distribution, and widened selector buttons.
- If future work adds real auth navigation, backend validation, or additional recovery modes, those new states should be added to the intro snapshot before they are exposed to rotation.
- The current app remains oriented by fullSensor while retaining the latest preview state through orientation changes.

Output Artifact

Generated cinerific_worklog_august 4.pdf at the repository root. The file follows the established Cinerific root level worklog naming, letter size PDF layout, text extractable content style, footer convention, metadata pattern, PDF 1.4 output, and no part filename rule for the first August 4 worklog artifact.

This artifact covers the Tuesday, August 4, 2026 Cinerific work that culminated in source commit 437405c, including the Forgot Username/Password layout refinements, the orientation navigation guard, the saveable native intro snapshot, emulator validation, snapshot refresh, and worklog generation pass.
