

Cinerific Android App Work Log - July 12, 2026

Compiled summary for Sunday, July 12, 2026 - focus: recovering the Cinerific Figma-to-code context, reopening the Android Studio workflow, reconnecting to the Figma file through the MCP/plugin channel, importing real Figma-exported artwork into the Android project, replacing Compose placeholder graphics with drawable resources, correcting the Frame 3 logo placement, and generating the first Cinerific daily worklog artifact. Generated automatically after reviewing the established Alla Vostra daily worklog PDF pattern, the current /Users/prahlin/gh/cinerific source state, the active Codex session work, the Figma design context for the Cinerific Intro and Sign-in node, Android Studio/emulator launch context, Gradle build/install output, and screenshot checks from the running Android app. This worklog is intentionally scoped to Cinerific work performed during this Codex session. Alla Vostra material was used only as the formatting and naming reference for this first Cinerific artifact.

Source Materials Processed

- Studied the root-level Alla Vostra worklog PDF corpus from the local clone of Prahlin/alla_vostra, whose remote points to https://github.com/Prahlin/alla_vostra.git. The review covered the naming convention, daily cadence, compact opening summary, source-material section, baseline section, goals, work-completed sections, validation section, files-touched list, follow-up context, and output-artifact close.
- Reviewed representative mature Alla Vostra worklogs, especially July 8 and July 11, to match the concise technical tone, letter-size PDF layout, footer convention, bullet density, and four-page daily-log shape.
- Reviewed the current Cinerific Git state in /Users/prahlin/gh/cinerific before generating this artifact. The working tree currently has one modified Kotlin source file and one new drawable-nodpi asset folder created from this session.
- Reviewed the current Cinerific source and resource list, including `app/src/main/java/com/prahlin/cinerific/ui/CinerificApp.kt` and the imported PNG assets under `app/src/main/res/drawable-nodpi`.
- Reviewed the active Figma MCP/plugin work from this session, including metadata and design context for file key `qbpfnwBirp0WoOHSqw1TN` and node `485:7118`, identified in Figma as the Intro & Sign-in flow.
- Reviewed the Android runtime work from this session: Android Studio launch, Cinerific_Standard_Tablet emulator use, Gradle assemble/install commands, app launch through adb, and screenshot checks taken from the live emulator.
- Used `rg`, `git status`, `git diff`, `pdfinfo`, `pdftotext`, shell inspection commands, Android/Gradle command output from the session, and this small standard-library PDF writer. No external PDF package was installed for the worklog.

Baseline Status Before Today's Work

- The Cinerific repository already contained a scaffolded native Android project using Kotlin, Jetpack Compose, Material 3, Gradle, a Java toolchain/JBR expectation, launcher resources, and an initial single-activity app surface.
- The app was able to build and open, but the visible UI did not yet contain the actual Cinerific Figma artwork. The onboarding/sign-in flow still depended on code-drawn color blocks, gradients, circles, and approximations instead of the file assets the user expected from the Figma project.
- Android Studio did not automatically reveal Figma images, boxes, buttons, animations, fonts, or other design assets because Android Studio only shows files and code that exist in the Android project. The Figma design file and MCP connection were separate from the compiled app until assets were explicitly exported/imported and referenced from Compose.
- The local VS Code MCP configuration existed, but the Figma connection was not functioning as a live bridge at the start of this recovery pass. The user specifically expected a direct channel into the local Cinerific Figma project, so the first practical task was to restore design access and make the path visible again.
- The prior design-to-code session context was scattered across Codex/Copilot history, Android project files, and Figma connector state. Before code work could continue cleanly, the session history and the intended Figma source had to be re-identified.
- No Cinerific daily worklog PDF existed yet. This artifact establishes the first Cinerific worklog using the same general daily-report tradition as Alla Vostra while keeping the content specific to Cinerific.

Main Goals We Worked Toward

- Recover the relevant Codex/Figma chatflow so the Cinerific design-to-code path could be understood instead of guessed from the current app surface.
- Open the Cinerific Android project in Android Studio, start the appropriate emulator, install the current app, and confirm what the user was seeing in the running Android environment.
- Explain why Figma design material was missing from Android Studio and the emulator: the assets and motion data had not yet been exported into Android resources or implemented in Compose.
- Re-establish working Figma access through the available plugin/MCP channel and inspect the exact Intro & Sign-in node in the user's Cinerific Figma file.
- Pull the actual Cinerific artwork from Figma into the Android project as resources, avoiding placeholder

gradients and avoiding invalid SVG-as-PNG resource imports.

- Patch the Compose implementation so Intro Frame 2, Intro Frame 3, and Sign-in use real Cinerific drawable assets instead of temporary drawn approximations.
- Build, install, launch, and screenshot-check the app until the real Cinerific visual material was visible in the emulator, especially the previously broken Frame 3 logo placement.
- Produce a first Cinerific worklog PDF at the repository root with the requested filename: cinerific_worklog_july 12.pdf.

Work Completed - Session and Chatflow Recovery

- Located the earlier Codex/Copilot/Figma setup thread associated with the Cinerific project and clarified that the user needed the chatflow, not only the raw session identifier.
- Generated a readable Markdown chatflow at /Users/prahlin/Desktop/cinerific_figma_mcp_chatflow.md so the earlier MCP setup and Figma-to-code conversation could be reviewed outside the raw JSONL/session format.
- Reviewed the Cinerific files and scripts enough to recommend the first commit message: feat: scaffold Cinerific Android Compose app. That message reflects the repository state before the real Figma asset import began.
- Kept the recovery work centered on the Cinerific project path, /Users/prahlin/gh/cinerific, rather than mixing in the separate Alla Vostra app codebase.

Work Completed - Android Studio and Emulator Runtime

- Opened the Cinerific project in Android Studio so the user could inspect the native Android project directly instead of working only from terminal output.
- Started the Cinerific_Standard_Tablet Android virtual device and used adb/Gradle commands to install and launch the app package com.prahlincinerific/.MainActivity.
- Confirmed that the running app was displaying only the current Compose implementation, not a live projection of the Figma file. This established the central cause of the user's complaint: the Figma design source existed, but the Android app still needed imported assets and implemented UI behavior.
- Used emulator screenshots to compare what was actually rendering before and after each implementation pass. These screenshots became the practical feedback loop for verifying that imported assets were visible, correctly scaled, and not clipped.

Work Completed - Figma MCP / Plugin Channel

- Inspected the local MCP situation and clarified that the direct Figma relationship had to be reactivated through the available plugin/MCP connector rather than assumed from Android Studio alone.
- Installed/used the Figma plugin tooling exposed to Codex and confirmed access to the Cinerific Figma file through file key qbpfnwBirp0WoOHSqw1TN.
- Read Figma metadata for node 485:7118, the Intro & Sign-in container. The frame list included 474:7309 Intro Frame 1, 474:7311 Intro Frame 2, 476:6937 Intro Frame 3, 478:6975 Sign-in Frame, and 482:7696 Star Overlay.
- Fetched design context for the Intro and Sign-in frames. The data confirmed that Frame 1 was black, Frame 2 used Cinerific logo artwork, Frame 3 used a large logo plus promotional background, and the Sign-in frame reused the promo background and Cinerific logo layers.
- Used Figma-provided asset URLs from the design context as the source of truth for the first real Android artwork import rather than recreating those visuals manually in Compose.

Work Completed - Real Figma Asset Import

- Created app/src/main/res/drawable-nodpi as the Android resource destination for Figma-exported bitmap assets that should not be density-rescaled by Android.
- Downloaded the real Cinerific PNG artwork from Figma into drawable-nodpi: logo_simple_intro2.png, logo_eyes_intro2.png, logo_simple_large.png, logo_eyes_large.png, promo_background.png, promo_background_signin.png, logo_simple_signin.png, and logo_eyes_signin.png.
- Removed attempted dot/ellipse files that were actually SVG payloads with PNG filenames. Keeping those files would have produced bad Android resources or misleading asset state.
- Kept the dot indicators in Compose as drawn circles for now because that is simpler, valid, and visually faithful enough for this pass while the more important bitmap artwork is imported from Figma.
- Left the asset names descriptive and project-local so future Cinerific Figma imports can extend the same naming pattern without needing to reverse-engineer anonymous exports.

Work Completed - Compose Integration

- Patched app/src/main/java/com/prahlin/cinerific/ui/CinerificApp.kt to import androidx.annotation.DrawableRes, Image, ContentScale, painterResource, and the project R class needed for drawable references.
- Replaced the temporary FigmaImageBlock gradient helper with FigmaAssetImage, a resource-backed Image composable using painterResource and ContentScale.FillBounds. This changed the core visual path from approximation to actual Android resources.
- Updated IntroFrame3FromFigma so it now uses promo_background plus logo_simple_large and logo_eyes_large from the drawable resources.
- Updated SignInFrameFromFigma so it now uses promo_background_signin, logo_simple_signin, and

logo_eyes_signin from the drawable resources while preserving the existing dark overlay behavior for the sign-in composition.

- Updated LogoSlide1Layer for Intro Frame 2 so the smaller Cinerific logo and eye layers come from logo_simple_intro2 and logo_eyes_intro2 instead of placeholder gradients.
- Reworked LogoSlide2Layer to operate inside the visible 1194 by 834 Figma frame rather than relying on the old 1668-pixel-tall wrapper math that pushed the large logo into a clipped position.
- Placed the large logo and eye layer at x 222, y 150, width 750, height 535, matching the visible logo bounds for the Intro Frame 3/Sign-in presentation in the Android frame coordinate system.
- Added LogoDot as a small Compose helper for the four frame indicator circles, preserving active/inactive dot states without depending on the removed invalid dot image files.

Work Completed - Visual Correction Pass

- Built the app after the resource import and Kotlin patch to verify that the new drawable references resolved through Android's generated R resources.
- Installed and launched the debug build on the running emulator, then advanced through the onboarding frames to inspect the updated visuals.
- Captured a screenshot showing Frame 2 with the real burgundy intro background and imported Cinerific logo artwork visible in the app.
- Captured a later screenshot showing Frame 3 with the real Cinerific artwork present but clipped too high, which identified the placement problem in the old LogoSlide2Layer coordinate math.
- Patched the Frame 3 placement and captured /tmp/cinerific_frame3_centered_assets.png, which showed the large Cinerific artwork centered and visible against the promotional background. That screenshot confirmed the key visible asset problem was corrected for this pass.

Validation and Checks Performed

- Ran git status --short --branch before worklog generation. The Cinerific tree was on main tracking origin/main, with CinerificApp.kt modified and drawable-nodpi untracked as expected from the asset-import pass.
- Ran git diff --stat before generating this PDF. The Compose implementation change is currently 106 changed lines in CinerificApp.kt, with 72 insertions and 34 deletions.
- Listed the Android source and resource files to confirm the new drawable-nodpi directory contains exactly the eight imported PNG files expected from the Figma export pass.
- Ran Gradle assembleDebug during the implementation session after importing the assets. The build succeeded after the resource references and invalid image attempts were corrected.
- Ran Gradle installDebug and launched com.prahlincinerific.MainActivity through adb during the session so the emulator reflected the current app build rather than stale output.
- Reviewed emulator screenshots from the session, including the corrected Frame 3 centered-asset screenshot, to verify that the imported Cinerific artwork now renders in the Android app.
- Did not create a Git commit during this worklog generation step. The repository still contains the active implementation changes and this newly generated PDF artifact for the user to review first.

Files Touched During July 12

- Cinerific Compose UI implementation: app/src/main/java/com/prahlin/cinerific/ui/CinerificApp.kt. This file now loads real drawable resources for imported Figma artwork, preserves promotional background overlay behavior, and corrects large-logo placement for the visible frame.
- Imported Figma artwork resources: app/src/main/res/drawable-nodpi/logo_simple_intro2.png and app/src/main/res/drawable-nodpi/logo_eyes_intro2.png for Intro Frame 2.
- Imported Figma artwork resources: app/src/main/res/drawable-nodpi/logo_simple_large.png, app/src/main/res/drawable-nodpi/logo_eyes_large.png, and app/src/main/res/drawable-nodpi/promo_background.png for Intro Frame 3.
- Imported Figma artwork resources: app/src/main/res/drawable-nodpi/logo_simple_signin.png, app/src/main/res/drawable-nodpi/logo_eyes_signin.png, and app/src/main/res/drawable-nodpi/promo_background_signin.png for the Sign-in frame.
- Session reference artifact already created outside the repository: /Users/prahlin/Desktop/cinerific_figma_mcp_chatflow.md. This file is not part of the Android source tree, but it records the recovered Cinerific MCP/design-to-code chatflow requested earlier in the session.
- Daily worklog artifact generated at the repository root: cinerific_worklog_july 12.pdf.

Follow-Up Context

- The next Cinerific code pass should import remaining Figma screens and components deliberately, one frame or flow at a time, rather than assuming the whole Figma file automatically exists in Android Studio.
- Figma fonts still need a proper Android path. The current code can show bitmap logo artwork, but app text fonts must be exported or mapped into res/font and then wired into Compose typography before Android Studio will display them as app fonts.
- Figma animations and prototype timing are not automatically active in Compose. The current app has Compose animation scaffolding, but any Figma motion needs to be translated intentionally into Compose animation specs and state transitions.

- Android Studio previews can be added or expanded after the resource import so the user can see important Cinerific screens in the IDE without always launching the emulator.
- The local MCP configuration should be cleaned up later if it still contains placeholder keys or stale figmaDesktop endpoint assumptions. The working path in this session came through the available Codex/Figma plugin connector.
- Before the first commit, review whether cinerific_worklog_july 12.pdf should be tracked with the app source or kept as a project-management artifact outside the commit. The code/resources themselves are ready for a focused first implementation commit after review.

Output Artifact

- This final worklog generation creates cinerific_worklog_july 12.pdf at the Cinerific repository root.
- The filename follows the user-requested Cinerific convention exactly, including the space before 12: cinerific_worklog_july 12.pdf.
- The PDF uses the Alla Vostra daily-worklog structure as a style and formatting reference, but the body content records only Cinerific work from this Codex session.
- No external PDF dependency was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior worklogs.
- Created this daily worklog PDF: cinerific_worklog_july 12.pdf.
